

## 17.3 Release Notes

### Bugfix

- Corrected a bug that attributed a lost to follow up status to patients who missed their appointment
- Improved performance of the patient status dashboard.
- New calculation method for the distribution of ARVs in community: now only the last prescription is considered.  $\text{Percentage} = \text{Community ARV distribution} / (\text{sum: Community ARV distribution} + \text{ARV distribution in institutions})$
- Henceforth, the home visit record no longer affects the status of LTFU patients.
- Corrected a bug that prevented viral load alerts from disappearing after a record update
- Now regimens containing Raltegravir or Abacavir are displayed

### New features

Download viral load results on iSanté.

Only a user with super administrator or administrator privilege can download the viral load results on iSanté. Figure.1

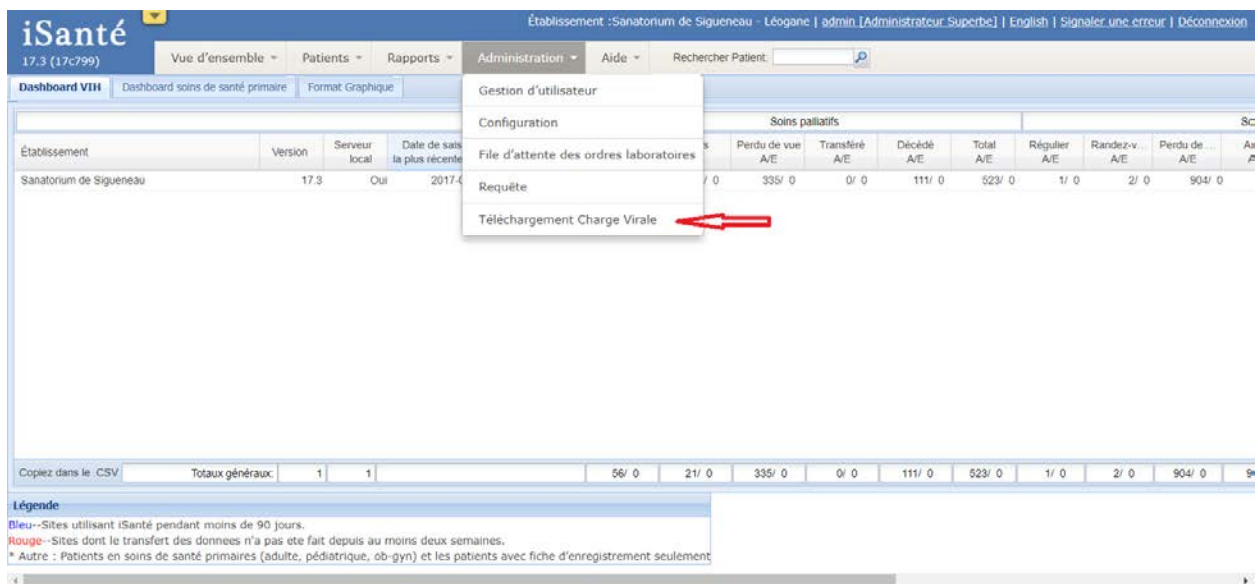

Figure 1

The user chooses the Excel file containing the results Figure2A, and click OK. A message appears to indicate the number of inserted results. The user can click the Show Errors button to get a list of uninserted results. Figure.2B

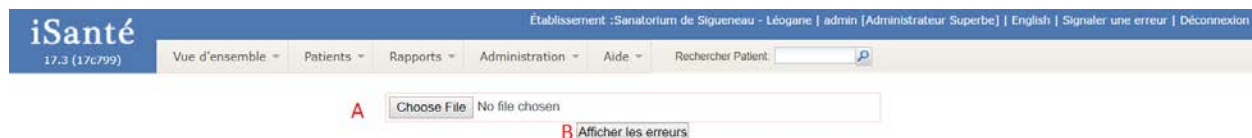

Figure 2

The user will have to copy and paste this list and investigate requests for these results at the site level and at the LNSP level.

Addition of new drugs to prescription form

#### Adult

- Dolutegravir 50mg QD
- Etravirine 200mg BID

#### Pediatric

- Dolutegravir 10mg / 25mg QD
- Etravirine 25mg / 100mg BID

## List of patients eligible for their first viral load (Figure 3A)
